Overall sequence quality assessment and vector trimming was conducted using the Lucy software (version 1.16s, http://www.tlgr.org/softlab/). Lucy parameters were set to ensure an overall trimmed quality of 97.5% or better without any vector fragments in the chosen high quality region of each sequence. Low-quality bases between the poly-T and the high-quality region were replaced with N's to serve as spacers using a Perl program (est_process.pl), written by Dr. Hui-Hsien

The conducted using the Lucy software (<a href="http://www.tigr.org/softlab/>).

Lucy parameters were set to ensure an overall trimmed quality of 97.5% or better without any vector fragments in the chosen high-quality region of each sequence. Low-quality bases between the poly-T and the high-quality region were replaced with N's to serve as spacers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Zea mays.

This clone is from an A. gambiae BAC library (ND-TAM) provided by
F.H. Collins and sequenced by The Institute for Genomic Research
(TIGR). The BAC library was generated from A. gambiae PEST strain
DNA. All DNA was extracted from newly hatched first instar larvae
to minimize the inclusion of DNA from microorganisms that inhabit
the gut. The DNA is derived from mixed sexes of larvae. The BAC
library was constructed at Texas A&M University BAC Center
University, College Station, Texas 77843-2123, USA using a HindIII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Contact: Brendan J Loftus

After the addition of EcoRI adaptors, the ds-cDNAs were digested with NotI size-selected. The resulting molecules were directionally cloned into the EcoRI and NotI sites of the pT7T3PAC vector. The library then went through one round of normalization to CoT value of 5 based on the methods of Marcelo Bento Soares (Genome Research 6: 791-806, 1996)."

Collins and sequenced by The Institute for Genomic Research (TIGR). The BAC library was generated from A. gambiae PEST strain DNA. All DNA was extracted from newly hatched first instar larvae to minimize the inclusion of DNA from microorganisms that inhabit the gut. The DNA is derived from mixed sexes of larvae. The BAC library was constructed at Texas A&M Universty BAC Center

                                                                                                                                                                                                                                                                                                                    //Octes*Vector: pBluescript SK-; Site_1: EcoRI; Site_2: XhOI; Construction of the cDNA library was carried out using Stratagenes 'UnizAp - cDNA synthesis kit'. cDNA contains a XhOI site within it. Following ds cDNA and sample was digested with XhOI. The result is cDNA and sample was digested with XhOI. The result is cDNA with an EcoRI sticky end on one side and a XhOI sticky end on one side and a XhOI sticky UnizAp arms. The vector is designed containing the cloned within this pBluescript sequence as well as lambda DNA and cDNA is then packaged using Gold gigapackaging extracts. Library was grown in XLIBlue MRF cells and amplified. The library was excised by mass excision using Stratagens 'Mass excised by mass excision using Stratagens 'Mass releases the pBluescript sequence and circularises it as plage) and secreted out of the host cell as phageinds. Splage) and secreted out of the host cell as phageinds. Was plated out on LB-amp plates to select for transformants. Approximately 1,000,000 colonies were grown and recovered by using Qulagen Midi prep kit. 2 micro grams of electroporation."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ammonium-grown"

TITLE OF INVENTION: Novel Sequences of E.

coli 0157

```
APPLICANT: MAKINO, KOZO
APPLICANT: HAYASHI, Tetsuya
APPLICANT: OHNISHI, Makotto
APPLICANT: HATORI, Masahira
APPLICANT: HATORI, Masahira
APPLICANT: KUROKAWA, Ken
TITLE OF INVENTION: Bolynucleotide molecules and polypeptides specific to Enterohemor
TITLE OF INVENTION: Escherichia coli 0157:H7 and use thereof
FILE REFERENCE: 2002-0050A/WMC/01704
CURRENT APPLICATION NUMBER: US/10/053,853A
CURRENT FILING DATE: 2002-05-28
PRIOR APPLICATION NUMBER: JP2001-112010
PRIOR FILING DATE: 2001-01-24
NUMBER OF SEQ ID NO 337
LENGTH: 58175
TYPE: DNA
ORGANISM: Escherichia coli 0157:H7
US-10-053-853A-337
